

# High Point™ – LTE Distribution Solution

The **LongReach Wireless HighPoint** solution when coupled with the LongReach Wireless (LRW) ODU provides Internet connectivity to dwellings, out buildings and remote properties where 4G wireless connectivity is currently unavailable or signal quality is too weak to support reliable and effective Internet. Experience has shown that many rural and regional properties may have a “high point” location where good quality 4G wireless signals can be received and sent.

At this highpoint, NB-Tec (or its installation partners) can install the LRW ODU to provide the 4G Internet connection and then beam the internet traffic to the desired farm or business locations using private microwave links for distances up to 25+Km line of sight. This solution can be mains powered if power is available at the highpoint or if not, we provide appropriate solar charged battery technology to power the site. The **LongReach Wireless HighPoint** solution is robust and scalable from a single point to point connection to multiple microwave links according to individual requirements.
